Xamarin forms prism bindablebase

In previous posts, we have begun to look at the basic concepts on how to leverage the new version of Prism (6.2) to implement the MVVM pattern in the Xamarin Forms app. So far, we haven't seen anything special that we can't do anyway with other frameworks: we've just created Views, ViewModel and we connect them through binding. In this post, we'll see how Prism can help to handle very common scenarios that can be difficult to handle in the MVVM app: navigation and page life cycles. As we mentioned in a previous post, we'll make customers easy for TrackSeries, a website that offers information about TV Shows. The app will display the current top series and will allow users to learn more about it. To achieve this, we can use a set of REST services provided by the website, which is very easy to use and that follows standard best practices for dealing with REST services: you use the URL using the HTTP command and you receive back JSON answers with the results. For example, if you're curious that is series at the moment, you can only create a GET HTTP request to the following URL: . The service will return JSON answers with all the details about the top series:[{ id:121361, name:Game of Thrones, followers:10230, firstAired:2011-04-17T21:00:00-04:00, country:us, overview:Seven noble families struggle to control the mythical land Friction between the houses leads to a full-scale war. All while very ancient evil evil evokes in the farthest north. Amidst the war, a neglected military order of misfits, the Night's Watch, is all that stands between the realms of men and the icy horrors beyond., runtime:55, status:Continuing, network:HBO, airDay:Sunday, airTime:9:00 PM, contentRating:TV-MA, imbdId:tt0944947, tvdbId:121361, imbdId:1399, language:en, images:{ poster: fanart, banner: }, genres:[{ id:2, name:Adventure }, { id:4, name:Drama }, { id:5, name:Fantasy }], added:2014-08-08T13:30:46.227, lastUpdated:2016-08-18T03:03:50.05, followedByUser:false, slugName:game-of-thrones }, { id:257655, name:Arrow, followers:7517, firstAired:2012-10-10T20:00:00-04:00, country:us, overview:Oliver Queen and his father are lost at sea when their luxury yacht sinks. His father did not survive. Oliver survived an uncharted island for five years learning to fight, but also learned about the corruption of his father and his unscrupulous business dealings. To structure my solution in a better way, I have decided to put all classes related to communication with the REST API (such as services and entities) in another Mobile Class Library called InfoSeries.Core, which is a different PCL than the one that hosts the actual Xamarin Form app. Here's a method that takes care of describing JSON previously to return the list of C objects# looks like:public async Task<T> GetSerieFollowersVM<T>(); GetStatsTopSeries() { use (httpClient client = new HttpClient()) { try { var respons = await client.GetAsync("http://api.seriefollowers.com/api/v1/series/topseries"); if (respons.StatusCode == HttpStatusCode.OK) { var message = respons.Content.ReadAsStringAsync().Result; var serieFollowersVM = JsonConvert.DeserializeObject<SerieFollowersVM>(message); return serieFollowersVM; } } catch (Exception ex) { throw ex; } } } The GetSerieFollowersVM<T> method of the HttpClient class made the GET request to the URL, returning the result, a string containing the JSON response. ini</SerieFollowersVM>; JSON automatically causes a collection of SerieFollowersVM objects. Here's a simple example: public class SerieFollowersVM { public int Id { get; set; } public string Name { get; set; } public string Description { get; set; } public string Image { get; set; } public string Url { get; set; } public int Followers { get; set; } public int Rating { get; set; } public int Score { get; set; } public int LastUpdate { get; set; } public int TotalFollowers { get; set; } public int TotalRating { get;
